

# Truth, beauty, and data revisited

## Session 15

PMAP 8921: Data Visualization with R  
Andrew Young School of Policy Studies  
Spring 2025

# Plan for today

**Telling stories with data**

**Curiosity**

# Telling stories with data

# Truth is beautiful

**Truth  $\neq$  facts**

**Truth comes from aesthetic  
combination of content and form**

**Facts require beauty to be true**

# Art

**Art is how we translate core, essential content (or truth!) to different forms for specific audiences.**

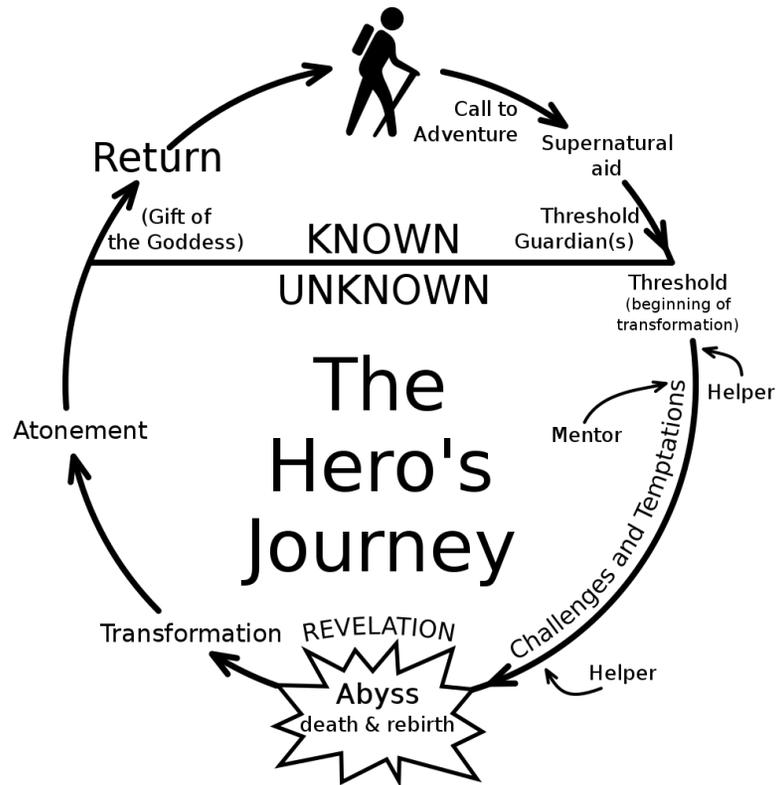

# Stories as art

**Stories are an *art form* for translating core, essential content to different forms for specific audiences.**

# Every story is the same

# Heroes

# You are not the hero

- About us
  - Company history
  - Market cap
  - # employees and # locations
- About our product and service
  - What it is
  - How it works
  - Why it's better than the alternative
- Call to action (ideally)

## XYZ Co. Equity Partners, LLC

- Founded in 1988 in Anchorage, Alaska
- Invest in companies who:
  - Provide professional IT services
  - Offer exceptional technical and project management expertise
  - Deliver complex data and information management solutions as systems and/or applications integrators
- Average annual revenue: \$51.5M

## XYZ Co. Software

- Established in 1984
- Headquarters: San Francisco, CA
- Integrated P&C Insurance software and services
- Focused on Alternative Risk & Self-Insured markets
- Recognized leader in risk management solutions
- Over 100 customers in U.S. and Canada

Points of view

## Storytelling

Martin Krzywinski & Alberto Cairo

*Nature Methods* **10**, 687(2013) | [Cite this article](#)

**1529** Accesses | **100** Altmetric | [Metrics](#)

Familiar elements underpin most stories: introduction, question, conflict, buildup and resolution. These can also be applied to data graphics. For example, use the idea of a story arc and make your presentation episodic—unfold it, don't dump it. In each part, make not only its content clear but its purpose easily discernible. This is particularly relevant when communicating to the general public, who may lack sufficient background knowledge to identify what is relevant or why it matters. At the same time, do not underestimate your colleagues' desire to be presented with a cogent exposition of your findings.

Published: 30 October 2013

## Against storytelling of scientific results

Yarden Katz [✉](#)

*Nature Methods* **10**, 1045(2013) | [Cite this article](#)

**862** Accesses | **147** Altmetric | [Metrics](#)

To the Editor:

Krzywinski and Cairo<sup>1</sup> beautifully illustrate the widespread view that scientific writing should follow a journalistic 'storytelling', wherein the choice of what data to plot, and how, is tailored to the message the authors want to deliver. However, they do not discuss the pitfalls of the approach, which often result in a distorted and unrepresentative display of data—one that does not do justice to experimental complexities and their myriad of interpretations.

## 555: The Incredible Rarity of Changing Your Mind

APR 24, 2015

It's rare for people to change what they believe, and if they do it, it's usually a long process. This week, stories of those very infrequent instances where people's opinions flip on fundamental things that they believe. Why does it happen in these particular and unusual circumstances? We explain. **NOTE: One of the authors of a study covered in this episode has asked that the study be *retracted*.**

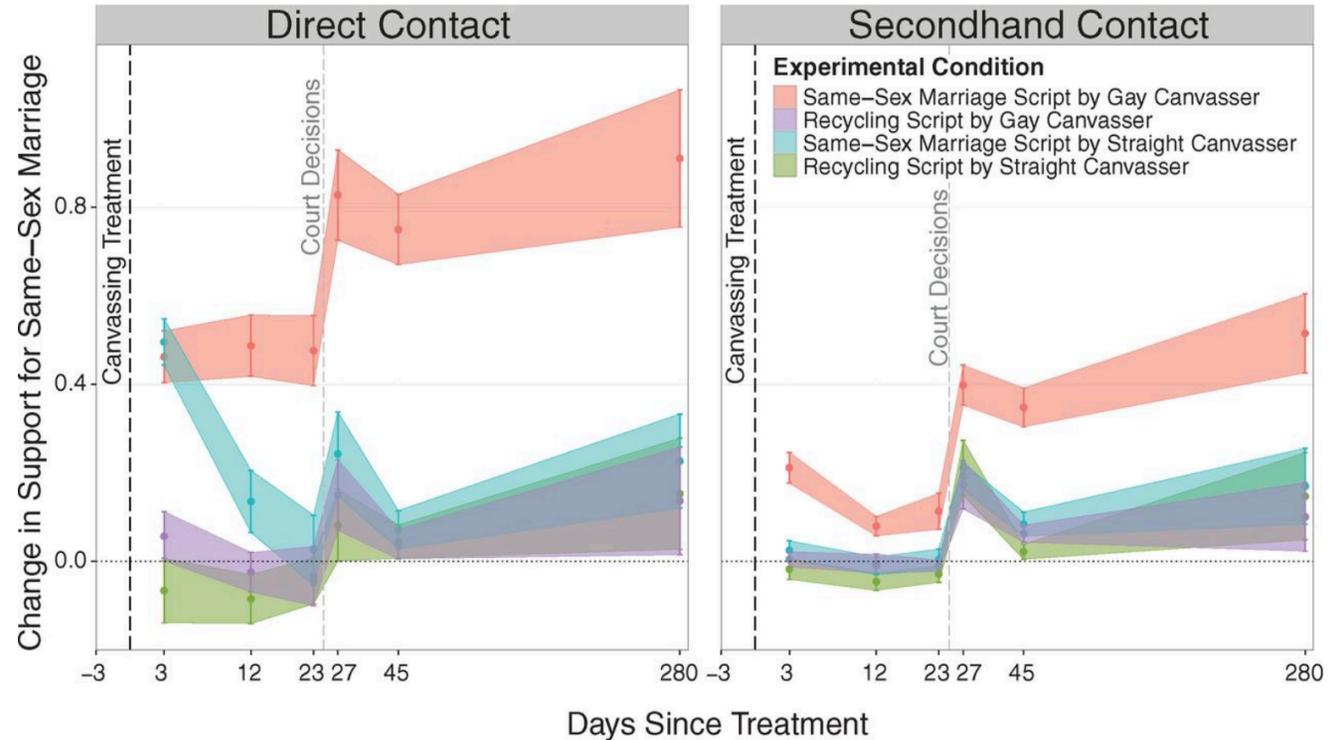

The iPad thing was LaCour's trademark. "He was sort of famous for taking his results from different studies he was working on, putting them on an iPad, and buttonholing people at the conferences and going over all of the research that he was doing, the different findings he had, and basically not letting the people go until they had an idea of what he was working on," says Tim Groeling, a communications professor at UCLA, who is listed as one of LaCour's references on his curriculum vitae. "It was infectious," continues Groeling. "Really cool stuff was on that iPad."

## The Role of Deliberate Practice in the Acquisition of Expert Performance

K. Anders Ericsson, Ralf Th. Krampe, and Clemens Tesch-Romer

The theoretical framework presented in this article explains expert performance as the end result of individuals' prolonged efforts to improve performance while negotiating motivational and external constraints. In most domains of expertise, individuals begin in their childhood a regimen of effortful activities (deliberate practice) designed to optimize improvement. Individual differences, even among elite performers, are closely related to assessed amounts of deliberate practice. Many characteristics once believed to reflect innate talent are actually the result of intense practice extended for a minimum of 10 years. Analysis of expert performance provides unique evidence on the potential and limits of extreme environmental adaptation and learning.

## Training history, deliberate practise and elite sports performance: an analysis in response to Tucker and Collins review—what makes champions?

K Anders Ericsson

bodies of knowledge for a more complete understanding of the complex development of elite performance.<sup>1</sup> In their recent article, Tucker and Collins<sup>2</sup> criticised a popularised but simplistic view of our work circulated on the internet, which suggests that anyone who has accumulated sufficient number of hours of practise in a given domain will automatically become an expert and a champion. Unfortunately they incorrectly attributed this view to me and my colleagues and criticised our research on deliberate practise.

**“[A] popularized but simplistic view of our work, which suggests that anyone who has accumulated sufficient number of hours of practice in a given domain will automatically become an expert and a champion.”**

## Gender Balance Assessment Tool (GBAT)

Women are cited less often than men, and are also underrepresented in syllabi. Yet even well-meaning scholars may find that they have difficulty assessing how gender-balanced their bibliographies and syllabi really are. Counting is tedious and prone to human error, and scholars may not know the gender identities of all the authors. GBAT helps to help with that, by automating the process of evaluating each author's name and then providing an estimate of what percent of the readings are by women.

Your assigned readings are approximately

**47.43**

percent woman-authored.

Race breakdown (probabilistic)

6.48% Asian, 14.39% Black, 2.74% Hispanic,  
2.68% Other, 73.71% White

# I'm a Developer. I Won't Teach My Kids to Code, and Neither Should You.

By JOE MORGAN

DEC 06, 2018 • 5:55 AM

Every step—precisely measuring ingredients, gauging mixed dough for smoothness and consistency, placing precision cuts to minimize waste—taught him something about quality. It's hard to teach the difference between merely executing steps, such as following a recipe, and doing something well. It can only be passed on through feel and experience. And every time you involve your kids when you work on something you value, you are teaching them how to do things well. You are preparing them to write code.

But you're not only teaching them that. You're teaching them the world is full of interesting things to discover. You're showing them how to be passionate and look for that ephemeral sense of quality in everything they do. The best part is that even if they don't become coders—most shouldn't and won't—the same skills can be used in nearly any career, in every hobby, in every life. When we force kids to learn syntax, we reinforce the idea that if something is not a blatantly employable skill, it's not valuable. Adults can learn syntax. Only kids can learn to embrace curiosity. 📌

## The academic job search finally comes to an end

I am *so beyond thrilled* to announce that I'll be joining the [Andrew Young School of Policy Studies](#) at [Georgia State University](#) in Fall 2019 as an assistant professor in the [Department of Public Management and Policy](#). I'll be teaching classes in statistics/data science, economics, and nonprofit management in beautiful downtown Atlanta, and we'll be moving back to the South. I am so so excited about this! The Andrew Young School does amazing work in public policy, administration, and nonprofit management, and I'll be working with phenomenal colleagues and students. I still can't believe this is real.

Part of the reason I'm in shock is that for the past 2.5 years, I've been ripped apart and destroyed by the academic job market. This job market is a horrendous beast of a thing. It is soul-crushing and dream-shattering and a constant stream of rejection. While facing rejection [is good and builds grit etc., etc.](#), in reality it's awful.

In an effort to stay On Brand™, here are a bunch of fancy graphs and numbers showing what it's been like to apply for nearly 200 jobs since August 2016. Unlike many of my other blog posts, I haven't included any of the code to generate these. [That code](#) is all available in a [GitHub repository](#) (see `README.Rmd`), along with the [raw data](#) that I've collected over the past few years (for the morbidly curious).

## Application count and outcomes

Between August 31, 2016 and November 18, 2018, I applied for 186 tenure-track and non-tenure-track academic jobs at R1 schools, liberal arts colleges, and teaching-focused public universities. I was offered one two-year visiting assistant professorship at the [Romney](#)

## Quickly play with Polity IV and OECD data (and see the danger of US democracy)

The [Polity IV Project](#) released new data yesterday, with democratization scores for 169 countries up to 2016. I wanted to check if the ongoing erosion of US democratic institutions since the 2016 elections registered in the US's Polity score, and, lo and behold, it did! We dropped from our solid, historically consistent 10 to an 8.

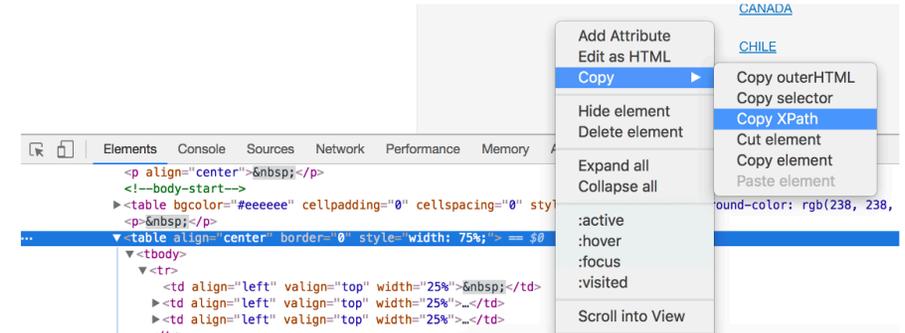

But is that bad? How does that compare to other advanced democracies, like countries in the OECD?

What follows below shows how relatively easy it is to quickly and reproducibly grab the new data, graph it, and compare scores across countries. (This notebook is also in [a GitHub repository](#).)

Before we start, we'll load all the libraries we'll need:

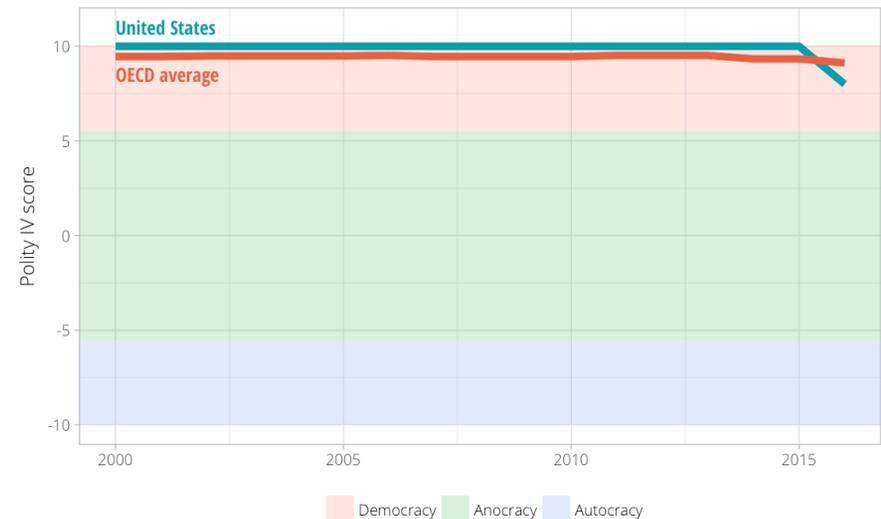

```
library(tidyverse) # dplyr, ggplot, etc.
library(readxl)    # Read Excel files
library(forcats)   # Deal with factors
library(countrycode) # Deal with country codes and names
library(rvest)     # Scrape websites
library(httr)      # Download stuff
library(ggrepel)   # Place non-overlapping labels on plots
```

First, we have to download the new Polity data. We could navigate to the [Polity IV data page](#) and download the data manually, but that's not scriptable. Instead, we can use `GET()` from

### Democracy in the USA

I wonder what happened in 2016...

## Tidy text, parts of speech, and unique words in the Qur'an

(See this notebook on GitHub)

As I showed in a [previous blog post](#), the [cleanNLP package](#) is a phenomenal frontend for natural language processing in R. Rather than learn the exact syntax for NLP packages like [spaCy](#) or [CoreNLP](#), you can use a consistent set of functions and let [cleanNLP](#) handle the API translation behind the scenes for you.

Previously, I used [spaCy](#) to tag the parts of speech in the Four Gospels to find the most distinctive nouns and verbs in the Gospel of John. Here, I'll show a quick example of how to use [CoreNLP](#) to tag parts of speech in Arabic. [CoreNLP](#) is far far far slower than [spaCy](#), but it can handle languages like Arabic and Chinese, which is pretty magical.

### Most unique nouns in the Meccan and Medinan surahs

## Tidy text, parts of speech, and unique words in the Bible

(See this notebook on GitHub)

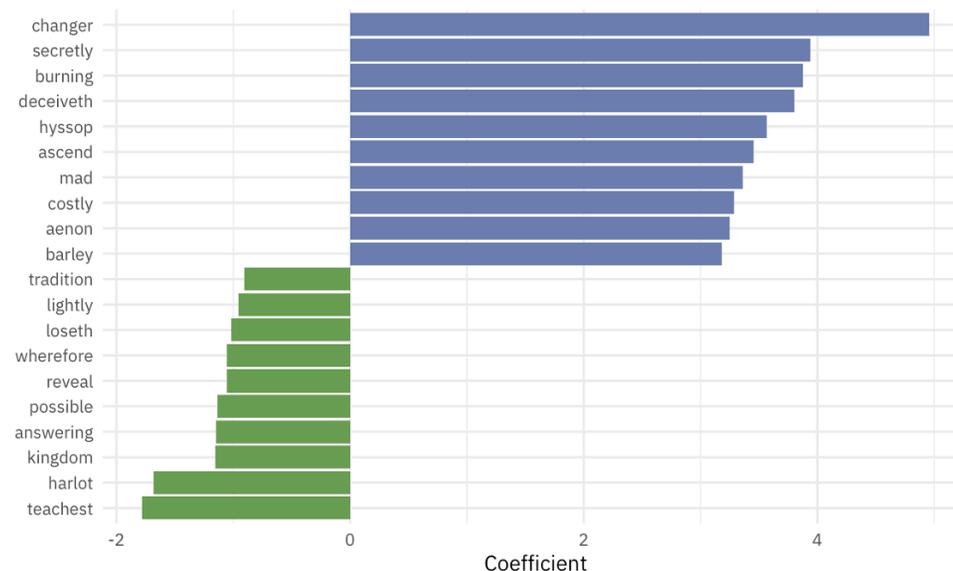

As part of my goal to read some sort of religiously themed book every day ([what I've read so far](#)), I've been reading [Eric Huntsman's new \*Becoming the Beloved Disciple\*](#), a close reading of the Gospel of John from an LDS perspective.

Near the beginning, Huntsman discusses several word frequencies that make John unique compared to the [synoptic gospels](#) of Matthew, Mark, and Luke (which all [draw on the same O source](#)). For instance, Huntsman states that John focuses more on themes of disciplin

### Words that change the likelihood of being in John

A verse with "hyssop" in it is probably from John

■ Increases likelihood of being from John ■ Increases likelihood of being from Synoptic Gospels

## Half a dozen frequentist and Bayesian ways to measure the difference in means in two groups

(See [this notebook on GitHub](#))

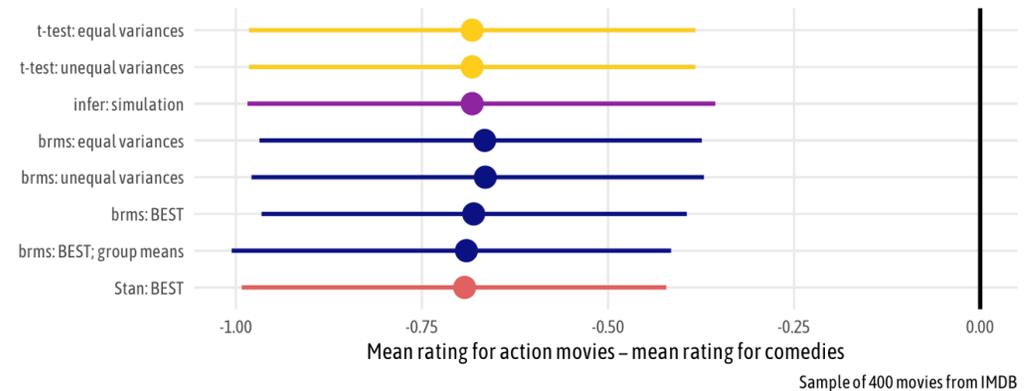

Taking a sample from two groups from a population and seeing if there's a significant or substantial difference between them is a standard task in statistics. Measuring performance on a test before and after some sort of intervention, measuring average GDP in two different continents, measuring average height in two groups of flowers, etc.—we like to know if any group differences we see are attributable to chance / measurement error, or if they're real.

Classical frequentist statistics typically measures the difference between groups with a **t-test**, but t-tests are 100+ years old and statistical methods have advanced a lot since 1908. Nowadays, we can use simulation and/or Bayesian methods to get richer information about the differences between two groups without worrying so much about the assumptions and preconditions for classical t-tests.

Mostly as a resource to future me, here are a bunch of different ways to measure the difference in means in two groups. I've done them all in real life projects, but I'm tired of constantly searching my computer for the code to do them:)

### Comedies get higher ratings than action movies

# Chidi's budget and utility: doing algebra and calculus with R and yacas

(See this notebook on GitHub)

A year ago, I wrote about how to use R to solve a typical microeconomics problem: finding the optimal price and quantity of some product given its demand and cost. Doing this involves setting the first derivatives of two functions equal to each other and using algebra to find where they cross. I showed how to use neat functions like `Deriv::Deriv()` and `splinefun()` and make fancy plots showing supply and demand and it's pretty cool. I wrote it mostly because I was teaching an introductory microeconomics course and wanted an easy, generalizable, and manual math-less way to make these plots for my students' exercises and problem sets, and it works great.

I'm teaching microeconomics again this year and decided to tackle a trickier problem that involves curvier curves, more variables, and more math. And the results are even cooler and open the door for more doing math and symbolic algebra directly with R.

**You are all expert  
enough now.**

**Go make  
beautiful things!**
